Applicant alleges "Hu fails to disclose or suggest Redirecting by that web server at least one browser request from that web server to another web server". Examiner respectfully disagrees, because Hu discloses a system for distributing user requests among plurality content servers 106 and 102. For example request manager 102 which also can act as a content server receives request and redirects that request to another content server (the same content server 102 who receives the request is the one that redirects the request to another content server)(see col. 5, lines 3-8 and col. 12, lines 35-42).

Furthermore, applicant alleges examiner's characterization is incorrect of Hu same content server which receives a request is one the one that redirects the request to another content server. To support such argument applicant further alleges Hu fails to teach elements that are not in the claim language such as "There is no suggestion anywhere in Hu that, in a multiprocessor system, these two functions are performed by a single application. Because Hu does not suggest that the content server application is itself capable of redirecting, Hu's system would not allow redirection to occur independently of whether the request manager application crashes or fails. In other words, because Hu teaches that a separate request manager application performs the redirecting, Hu's content server application is held captive to the availability of the resource manager application" (see page 3, lines 14-21).

Examiner respectfully disagrees applicant assertion that "Hu fails to disclose or suggest Redirecting by that web server at least one browser request from that web server to another web server", because Hu teaches "The client request is handled by

the various software components of network request manager 102: server module 202, rules module 204, policy modules 206, and connection module 208. Network request manager 102 responds to the client request with either the results of servicing the request, or with information which will allow client 104 to contact directly (i.e., "redirection information") the content server 106 selected to service the request" (see fig. 3 and col. 6, lines 11-23).
